Mission

The Vulcan Survey Ship is one of the first mass-produced starships built by the Vulcan Confederation and is used to survey surrounding star systems for various scientific phenomena.

Background

The Survey Ship represents the pinnacle of Vulcan Confederation space technology in the mid-20th century. In its first decade of service, the Survey Ship has already catalogued dozens of new stellar phenomena and made covert scans of several primitive species within one sector of Vulcan.

Features

The Survey Ship is equipped with laser cannons and one fusion missile launcher for defensive purposes, most often to clear interplanetary debris. The Survey Ship also features the latest in Vulcan material sciences, equipped as it is with hull plating designed to withstand numerous micrometeorite impacts.

Another marvel featured on the Survey Ship is its advanced (for its time) ion drive, allowing the ship to achieve speeds of .2c at sublight velocities. For interstellar travel, the ship's highly experimental warp drive allows it to travel across an entire light-year in just 2 months.
